Whether you buy Photoshop or not, you need to learn how to use layers (see Chapter 6) in order to get the most out of it. ## Understanding the Drawing Menu Photoshop enables you to draw with your mouse in any program by clicking to start a \_drawing layer,\_ which is a layer that you have currently created and can use to draw and format text, images, and more. By enabling the drawing tools when

---

drawing, you can draw a transparent color line under the image, for example, over a background image. You can also adjust colors, brush settings, and other elements such as how your font is formatted. To see a sample of a drawing layer, select a drawing layer for editing by choosing **Layer⇒New** from the Photoshop menu bar. Doing so opens the **New Layer** dialog box in Figure 5-9. From there, you can choose to make a new layer, which makes one new layer under the existing image;

---

merge all layers down into a single layer;  
or merge all layers into a single,  
transparent layer that covers the image.

**FIGURE 5-9: Click Create New Layer to create a new layer, or select one from the dialog box. Here are the icons you see on the menu that appear when you click the command shown on Figure 5-10: \***

**\*\*Draw:\*\*** Creates a new layer. Use this option if you don't want to work with an existing layer and want to create a new one. \* **\*\*Undo:\*\*** Undoes any changes

---

made by previous drawing commands. \*

**\*\*Redo:\*\*** Redoes the most recently undone command. It's faster than using Undo, but it doesn't work if you've used the Undo command more than twice. \*

**\*\*Rectangular selection:\*\*** Creates a rectangular selection (see Chapter 12) on a layer. \*

**\*\*Elliptical selection:\*\*** Creates an elliptical selection (see Chapter 12) on a layer. \*

**\*\*Paths:\*\*** Opens the Paths panel, which enables you to draw paths or pen strokes (see Chapter 14). \*

**\*\*Use**

---

**Selection:** Use the selection you're currently creating as the source for new paths or the design element you're about to use. **Free Transform:** This command enables you to resize, rotate, and distort layers using the mouse. See Chapter 8 for details. **Expand**

**What's New in the Adobe Photoshop 2022 (Version 23.0.1)?**

The present invention relates to an

---

improved catheter to be used for delivery of a medical device into a lumen of an artery or other vessel. Stent delivery catheters are well known in the art. These devices typically include a catheter shaft having a proximal end, a distal end, and a lumen extending therebetween. A stent is disposed longitudinally along the lumen of the catheter and is mounted or disposed around the distal end of the catheter. A balloon mounted on the distal end of the catheter is designed to inflate radially

---

outwardly to expand and deploy the stent radially outwardly as it is advanced through the lumen. Once the stent is in the desired location, the balloon is deflated and withdrawn. A second stent can be disposed along the lumen of the catheter. This type of catheter is known in the art as a `single stent` catheter. In the single stent catheter, the balloon is used to advance the second stent proximally along the lumen to the desired location. Once at the desired location, the

---

balloon is deflated and withdrawn. The second stent is collapsed, axially constricted and retained on the distal end of the catheter in its contracted state by a retention device and, in one embodiment, compressed into a desired shape. Thereafter, the catheter is advanced over the second stent to the desired location, at which point the first stent is then deployed by deflating the balloon to expand radially outwardly and permit the first stent to deploy. The single stent catheter is

---

intended to be used for treatment of arteriosclerotic disease, such as in coronary arteries, carotid arteries, and peripheral arteries. Another type of catheter includes a balloon mounted on the distal end of the catheter to expand radially outwardly. A wire is then guided longitudinally along the lumen of the catheter and through the lumen of the stent into the lumen of the balloon. The distal end of the balloon is then inflated to expand the stent. Thereafter, the balloon is

---

deflated and withdrawn. One problem associated with these known catheters is that they can be time consuming to manufacture and use. The known catheters include multiple pieces that must be assembled. The stent must be crimped on to
