What's New in the AxioVision LE?

It's time for another major release and as usual we've carefully curated this software update to bring you a range of improvements and new features. To begin with let's take a

quick look at what's in this release. The main new feature in this update is the ability to work with layer styles and brushes in Adobe Photoshop. If you already use the latest version of Photoshop you'll know that this feature is already available to you. This update allows you to use these tools in AxioVision LE to create a range of stunning customised effects. As an example we've created a range of cool customised effects using layer styles and brushes. These effects create a customised look for any image. The next major feature added to this update is a new interface that allows you to work with regular and 16:9 stretched image types. This means that even if you have not added the 16:9 stretch option on your camera or microscope you can still

use AxioVision to create the same look. This is a huge boon for users who don't have a camera that offers the 16:9 stretch or who have an old camera without this option. Although the new 16:9 stretched mode takes the 16:9 aspect ratio from your image, it uses the full resolution in the vertical direction. This means that you can create a beautiful image with the same size and resolution in the stretched mode. As an example you can see a few of the amazing effects we've created using the new interface. This update is also perfect for users who have gotten into an image and suddenly realise they need to remove some people or objects. We hope you enjoy this software update and look forward to hearing what you think of it. We certainly

hope it's a big improvement to your ability to create breathtaking images using AxioVision. AxioVision LE
