Universities across the world are working in partnership with the Water Institute at the University of Western Australia to use the institute's Rapid Cycle Analysis (RCA) toolkit to find out where to best put scarce water resources. Trevor Hatchett, Digital Impact Manager at the Western Australian Water Institute, says not only does the RCA allow universities to combine science with management and planning, it allows them to focus on areas which may be more important than they thought. "The RCA method is designed to help you identify the biggest risks and vulnerabilities to find or create the most valuable priorities for water management," says Hatchett. "The combination of the RCA, visual modelling and case study analysis methodologies allows a decision maker to map a spatial view of what makes a region water-vulnerable and, at the same time, map the possible adaptations that are appropriate to act upon the identified problems." The team have now had the ability to put the results to good use, says Hatchett. "We were recently commissioned by the Queensland Government to develop a regional flood warning zone based on the analysis we conducted." Hatchett says the RCA toolkit and the ability to pilot it made

it “a simple, effective and practical method”. “We’ve used RCA in our daily work for years now, and we’re really excited to make the tool available to other universities and to government, so that we can drive forward their capacity to carry out informed water management planning and decision-making.” In this 20-minute RCA tutorial video, Hatchett and his colleagues explain the RCA workflow and how it works in practice. “The point of the toolkit is to help you make sense of complex systems, not to try to make them easy. It is the ability to sift through the necessary pieces of information, that require expert interpretation, and to navigate, respond and explain the results, that makes the tool so valuable.” This is a fantastic, entertaining story of political life. Written with wit, sharpness, and charm, the book is dedicated to “John Adams, the kindest and best of humans.” The book is about the life and times of John Adams, the second President of the United States. I’m no expert on the Constitution, but I found

Q: What's the best way to develop full-text search using MySQL? I'd like to develop a search using MySQL. Basically, I want to search not only keywords but also the file names, the files' description, the file size

and date modified, the timestamp of the files, the creation date of the files, etc. I know that the built-in full-text search available in MySQL and PostgreSQL has been great at this task, but I don't like the requirement to install some additional packages. I was just wondering if somebody came up with a clever MySQL solution that is both awesome and very lightweight. I will be deploying the application to a Windows Server. A: I realize this is an old thread but if you are still looking for full-text search options, [MySQL Full Text Search Docs](#) are a great resource. A couple of options that I know of are: You can install Sphinx on the server and use MySQL for the storage. Sphinx is an open-source full-text search solution that supports regexp-like matching. You can use a commercial tool like Varonis I think both of these options have trial versions and, if you are interested in each, there is a decent amount of documentation available on each tool. A unified underpinnings of rheological and viscoelastic properties of water: a new percolation transition theory. We discuss the flow properties of water, which are of a very special interest in several fields, from geology to physics. We consider the dynamics of the position and velocity of the particles in the media, namely the water. The microscopic modeling of the water is performed by means of a classical hard-sphere model in

the canonical ensemble. The theory is based on the statistical mechanics of the fluid. Our approach yields a Unified Theory of the rheological and viscoelastic properties of water. In particular, we present a comprehensive and unified picture of the non-Newtonian behavior of water, i.e. the shear and bulk moduli and the viscosity of the fluid. We discuss the percolation transition in water, its physical origin and meaning. In our interpretation of the relation between the underpinnings of the rheological and elastic properties of water we found a deep connection between the entropy of formation of the "bonds" which describe the network of the water structure and the energy needed for
