iMovie iMovie is the video-editing program that comes with OS X. It lets you produce videos from still images or from video clips. It was the first OS X program I used. However, it has grown a bit over the years to include more tools. You can use the program to add simple audio narration to a video, add transitions, add music, and other cool features. See Chapter 15 for more information on iMovie.

[The somato-mental syndrome]. For a long time the term somato-mental syndrome (SMS) has been used to describe somatoform disorders in which there is no demonstrable organic disease. The authors present the results of a 2-year follow-up of 66 patients with SMS. The pre-established diagnosis was confirmed in 74% of the cases. The follow-up revealed a disabling psychopathological profile, with the most common symptom being the presence of tension disorders. The impairment in occupational integration and the severity of psychosocial disability were correlated with the intensity of depression. The long-term outcome was favourable in most cases. The authors underline the utility of DSM III-R classification of somatoform disorders and the relationship between somato-depressive and somato-obsessive disorders. Capitalism Explained Capitalism Explained is a book by Nobel Prize winning economist F. A. Hayek, first published in Great Britain in 1945. Hayek praises capitalism, and criticizes socialism. This publication was serialized in the magazine Reader's Digest beginning in February 1945. Chapter 1 "The confusion between the monetary and the economic is of great importance in economics, and of course in politics as well. The mistake made most frequently is to confuse the government's control of money with its control of the economy; or, at least, to confuse the desired control of money with the way in which it is achieved. It is by no means true that the control of money by the government is the same thing as the control of the economy by the government. This is more than shown in the fact that, given the same control of money, there is an exact correlation between the control of money and the control of the economy; but that there is no such correlation between the use of the two forms of control." Chapter 4 "It should be remarked that, in so far as the system of private enterprise gives rise to special problems (a very large number of problems actually), the political machinery of the State is the main instrument by which this system is safeguarded.... Public expenditure is necessarily based on two distinct ideas: on the one hand, the State cannot be isolated from other societies; at the same time, on the other hand, it cannot be isolated from those enterprises which represent their individual members. But the issues here involved are so profound that no attempt at a summary of them has ever as yet succeeded in arousing much interest." Notes

This invention relates to mass spectrometry, and more particularly, to suppressing background ions in a mass spectrometer. Mass spectrometry is a well-known technique for identifying molecules and isolating a particular compound of interest. A mass spectrometer takes a sample in its sample chamber, ionizes the sample molecules, and analyzes and detects the ionized molecules. The most common type of ionizing devices in mass spectrometry are radio frequency, dc, or inductively coupled plasma arcs. In these ionization devices, the sample molecules are ionized by collision with charged atoms or charged droplets of the plasma. Collision ionization, however, requires neutral molecules to be present. If the molecules are not in solution, or if the sample molecules are not soluble in the solvents used, the samples must be dissolved into solution prior to introduction into the mass spectrometer for ionization. A common ionization technique, therefore, is chemical ionization. If the sample is chemically ionized, the ions are produced from the sample molecule by vaporizing the molecules and then allowing the ions to fall by gravity into an ionization chamber. The simplest way to mass spectrometer a sample having chemical ionization is to introduce the sample into the sample chamber of the mass spectrometer, attach a nebulizer to the sample chamber to vaporize the sample molecules, and then introduce the sample vapor into the mass spectrometer's ionization chamber. The ions are formed in the ionization chamber and introduced into the mass spectrometer's detector chamber. In some embodiments, the ions are accelerated to a sufficiently high voltage to break a gas molecule into its constituent parts, i.e. electrons and ions. Then the electrons are detected and the ions are directed to the detector. In a typical configuration, a sample solution is introduced into the sample chamber through a nebulizer. The nebulizer removes the solvent from the sample solution and vaporizes the water, so the remaining sample solution contains the sample molecules. To be ionized, the solution typically requires a solvation agent to be added to the nebulizer. The nebulized solution is then introduced into the mass spectrometer's ionization chamber. The nebulizer is maintained at a slight positive or negative voltage, typically the polarity of the positive voltage, to divert sample molecules into the ionization chamber rather than remove the sample molecules from the ionization chamber. Alternatively, the ionization chamber may have a direct connection to a vapor source
