Edit Photos The "Enable original image" option can cause trouble when editing images with Photoshop Elements. Once you select this option, the original image is "locked" and you can not access the original image when you finish editing. This is very frustrating because you can not access the original image, save it, or find it when you are finished. The "Enable original image" option must be switched off for each image after you have completed your work. Templates Next Simple - Must have. No more navigating through 16 tabs to find the right template! This is a must have feature. Show Original - Must have. Overlay - No. I wish I could change this. Appearance - I hope they change this so that they use full, unscaled pixels (i.e. 1 pixel = 100% scaled) for the sizes offered. or more of the following conditions: A. End stage renal disease. B. Chronic glomerulonephritis. C. Chronic interstitial nephritis. D. Chronic pyelonephritis. E. Renal transplantation. F. Renal tubular acidosis. G. Any other renal disease presenting with the need for renal replacement therapy which cannot be adequately treated by dialysis. It is often said that RRT is a requirement of disease. RRT is sometimes used interchangeably with dialysis, but that is not true. RRT, unlike dialysis, does not need to be chronic and involves occasional replacement of electrolytes, acids, and so on. Dialysis depends on the concentration of ions and the ability of the kidneys to take care of them. Every day your kidneys deal with the various problems of the metabolism of your body, such as balancing acids, regulating osmolality, and secreting hormones. Diabetics, for example, must have a diet low in phosphates and potassium and high in sodium and glucose. A patient of dialysis needs to consume huge quantities of water to be ultrafiltered and to have the water purged by means of dialysis. This is termed "dialytic treatment." There is another form of RRT called hemodialysis (HD). Here water is eliminated from the blood by a process that occurs in the dialyzer. The blood comes into the dialyzer, where water is released and deposited. The patient then returns to the body and the process is repeated. HD is performed three times a week for 4 hours at a time. HD is a very bad thing. It is very stressful to the patient and often life-threatening. Patients have to make frequent visits to the dialysis center and undergo this process for several hours every week. It is not fair to these patients. They need a better method. Many patients, especially the elderly, have a condition called anuria. This means that the kidney is not reabsorbing water from the urine. This condition results in high blood pressure, heart disease, and certain kinds of cancer. The disease can sometimes be corrected by a return to a more normal diet. One example of this is cereals, whose consumption can result in a decrease in blood pressure. The kidney is dependent on the blood pressure for the filtration of water from the urine. Patients with end-stage renal disease often accumulate excess uremic toxins in
