A: We work with IEC 60870-5-101 specification as it is less restrictive for vendors. When you use a key that does not exist in the key list, you will receive the following message: The serial port number or key to bind to is not valid. Please choose another. It looks like a redundant protection of the data sent to the PLC. To use a different key, search it in the key list and enter it into the field. 1. Field of the Invention The present invention generally relates to the field of e-mail transmission, and more specifically to detecting unsolicited e-mail. 2. Description of the Prior Art E-mail is a form of electronic mail in which digital messages are delivered to recipients over a communications network. Internet mail, using the Simple Mail Transfer Protocol (SMTP), is one type of e-mail. Electronic mail or e-mail is distinguishable from postal mail in that it does not have to be delivered to a physical location. Although it may be sent to a postal box, it may be received over a wide variety of electronic means. The distinction between e-mail and postal mail, however, does not include a requirement that the recipient actually open the message. Unlike postal mail, the recipient of an e-mail has no ability to determine if it is junk mail, spam, or other unsolicited communications. Spam is commonly defined as "junk" or "non-intended" e-mail. It is sent indiscriminately to a large number of people. Many online communication sites, such as instant message (IM) and e-mail services, include an anti-spam functionality. Typically, spam is addressed to a large number of recipients, using a technique that may involve repeated sending of the message to a single individual. The Problem There are many methods for sending an unwanted message. Spam is sent through electronic devices, such as client computers or servers, and over the internet and other communication networks. Various network service providers provide anti-spam tools that can either be used by users or embedded in their server infrastructure. There are several anti-spam and other techniques for identifying unwanted e-mail. Many such techniques look at the header of the message. Some of the header data includes a message id, source of origin, mail originator, source mailserver and destination server. Other header information includes a subject line, a body
