A diagnosis of overweight or obesity can prompt an overweight or obese person to seek weight loss treatment. Another reason for a potential lack of medical diagnosis in overweight and obese patients is the misguided assumption that a lack of symptoms means the overweight and obese person is healthy. Typically, overweight and obese people are not overweight or obese simply because they are happy and fulfilled with their lives. Instead, overweight and obese people often struggle with fatigue, aches and pains, muscle and joint pain, constipation or diarrhea, frequent changes in blood pressure, and a plethora of other health complaints. A diagnosis and treatment plan can help mitigate the untoward health consequences that can accompany overweight and obesity. For example, a diagnosis of overweight or obesity may allow an obese person to receive weight loss treatment. However, many patients fail to receive weight loss treatment because physicians and insurance companies assume that obese patients are already sufficiently motivated and capable of making good decisions. Doctors may also lack knowledge about obesity. It is estimated that only half of those physicians who treat overweight and obese patients receive training in weight management. Consequently, many doctors are unaware that overweight and obese patients may have a reduced success rate of weight loss if they fail to provide weight loss treatment. It is often more convenient to give an obese patient a prescription for diet pills or a laxative, rather than to encourage the patient to change his or her lifestyle. Although insurance companies may provide coverage for overweight and obese patients, they often demand additional information before authorizing a patient to receive weight loss treatment. Obese patients may also have trouble accessing weight loss treatment because an adequate treatment facility may be miles away from a patient's home or work. As a result, obese patients may forgo weight loss treatment due to lack of access to care or poor availability of treatment facilities. Other reasons exist for misdiagnoses of overweight and obesity. Some physicians assume that the poor health of a person with an "obese" BMI indicates that the person is fat for other reasons. For example, physicians may consider an obese person with the metabolic syndrome overweight. The presence of the metabolic syndrome may indicate that the obese person is suffering from the increased risk of cardiovascular disease that accompanies overweight and obesity. However, the metabolic syndrome is also associated with certain health risks of its own. In addition, physicians may be unaware of the existence of overweight and obesity treatment modalities that may be effective for the patient. Compliance with clinical diets or regimens may be further hindered by the relative inaccessibility of the target population, lack of educational materials, poor accessibility of medical facilities, lack of behavioral specialists, and certain cultural factors. For example, the initial stages of a clinical diet

and regimen may be difficult for many individuals because of a lack of family, social, economic, and other support systems. Additionally, treatments that are effective for a small percentage of the population may be ineffective for a larger percentage of that population. 5ec8ef588b
