Pelican 2.3 is a solid update that adds new features and an improved interface (for some) and a slightly improved workflow for its users. My biggest issue with the previous version of Pelican was that it was difficult to navigate to images in specific folders; as a result, people who have several folders full of images take a long time to find what they want. After the big release of Lightroom 5, Photoshop users may find themselves seeking a replacement for Lightroom's metadata features. With the new Express Metadata, you can store field-level tags on your files and use a combination of Autocad.xlsx templates to map both tags and text data to your documents in a structured, controllable, and easily manageable manner. These templates are great for quick and easy batch tagging of your images. As many users may already know, this latest version of Photoshop is completely free. However, this latest release makes graphics and business professionals even more enthusiastic about the various ways the app can help deal with their clients' marketing and branding needs. With the tag & tag in Panel, you can layer photos and create your own branded or marketing content. Luminance HDR is a particularly interesting feature that should give your photography a boost. Using HDR technology to adjust brightness, contrast and color across a series of photos taken under various conditions, Luminance HDR automatically improves image detail by mitigating noise, visual artifacts, and pixel-level detail. Note that the preview mode is only available at the end of the adjustment. It's a great idea to try it out before picking a process. HDR is a bit tricky, however, even if you are a seasoned HDR user.

When you want to get best performance out of Photoshop, you will need to set up a proper graphics card. Make sure that you have the following:

- Adobe Photoshop requires more than just a graphics card to run. It requires as much RAM as possible. The most common problem is that users run out of RAM and start using hard discs for storage. The issue is that the RAM is only 64MB; Windows only offers 32MB of RAM for the user process while your graphics card only offers 64MB. Additional 32MB of RAM (or higher) is required for a good experience. You may try to use the 64MB RAM for your program but be aware of the risk.
- A compatible DVD driver is required for DVD recording or burning. Otherwise you will be getting strange misfire while burning files as well as the program will not be able to import files saved after the release of the version you are using.
- Adobe Photoshop requires a display card capable of support for the color modes of the images you are working on. This is done for the best quality of all the layers in the program. You should always make sure that your drivers are current. Make sure that the monitor you are using is color accurate and you will be able to get real-time previews of your work in the program.
