A prospective randomized trial to compare early (initial) and delayed (consecutive) reconstructive procedures following gastric surgery. Studies on the role of early reconstruction have been hampered by the retrospective design and small numbers of patients studied. To confirm the value of early reconstructive procedures in preventing anastomotic breakdown and reducing postoperative complications in patients undergoing gastric surgery, we performed a prospective randomized trial comparing early (initial) and delayed (consecutive) reconstructive procedures. A total of 68 consecutive patients undergoing gastric surgery between May 1999 and May 2001 were studied. The patients were randomized into two groups with one group undergoing early (initial) reconstruction and the other group undergoing delayed (consecutive) reconstruction. Anastomotic breakdown occurred in 6 patients (2.5 per cent) in the early group and in 0 patients (0 per cent) in the delayed group. Mean (SD) postoperative complications (Clavien-Dindo Grade 2 or more) were significantly less in the delayed group (16 patients, 26.7 per cent) than in the early group (35 patients, 55.7 per cent) ( $P = 0.03$ ). The total postoperative complication rate was significantly less in the delayed reconstruction group (42 patients, 65.6 per cent) than in the early reconstruction group (62 patients, 95.4 per cent) ( $P = 0.001$ ). Anastomotic breakdown and the incidence of postoperative complications are significantly less in the delayed reconstruction group than in the early reconstruction group. These results suggest that early reconstructive procedures are more beneficial than delayed reconstructive procedures.

Q: Are there any books or sources to learn about the mathematics behind security of encryption? I'm learning about cryptography and want to make it a career so I want to learn as much about it as I can. I know that I want to be an encryption expert but I want to do it the right way. Are there any books that explain the mathematics behind encryption and key length to make me an encryption expert?

Resting myocardial perfusion with  $^{99m}\text{Tc}$ -HMPAO: a comparison with  $^{201}\text{Tl}$ . Resting myocardial perfusion with  $^{99m}\text{Tc}$ -HMPAO and  $^{201}\text{Tl}$  was compared in order to evaluate and demonstrate the potential of  $^{99m}\text{Tc}$ -HMPAO as a tracer for cardiac imaging. Determination of the tracer uptake by the normal and diseased myocardium was based on external measurements of the radioactivity of the heart-lung ratio. The results show that  $^{99m}\text{Tc}$ -HMPAO is a powerful tool to evaluate rest perfusion and is superior to  $^{201}\text{Tl}$  for this purpose. The resting uptake of  $^{99m}\text{Tc}$ -HMPAO can be reliably evaluated from 3 to 24 h p.i., the half-life time of the radiopharmaceutical. A three-step approach was used to separate the different myocardial tissues.  $^{99m}\text{Tc}$ -HMPAO shows a high energy transfer and minimal redistribution. The final procedure to measure the myocardial distribution of  $^{99m}\text{Tc}$ -HMPAO required two tracer injections and simultaneous acquisition of a single-photon emission computed tomography (SPECT) image and a gamma camera image. A correlation between  $^{99m}\text{Tc}$ -HMPAO and  $^{201}\text{Tl}$  perfusion imaging was found in the normal myocardium. In the ischemic segments the  $^{99m}\text{Tc}$ -HMPAO perfusion was
