In what is a significant new update, this feature is now available as well as a standalone app. Instead of remembering the last time you need to activate a plug-in, you can initiate the plug-in activation process from within Photoshop. This certainly smooths the activation process and making it repeat when needed. But it does add complexity to the overall plug-in installation procedure and will likely deter novice users even more than the previous version. Not only does Photoshop allow you to import images from your camera, the plug-in API also allows you to use Adobe's Camera Raw file format. With your RAW files loaded into Photoshop, the plug-in API allows you to make changes to the raw file while you are in Photoshop. This allows you to make adjustments while keeping your images intact. This is a really cool feature and allows for a kind of photo editing that the digital domain just hasn't equipped us for yet. But, unfortunately, it also opens up a whole new can of worms. Quickly, we will show you how to export you image changes as a new Camera Raw file and share it with other editors. That being said, how do you automatically import your RAW files into Photoshop without confusing Photoshop to begin with and how do you export the new changes from Photoshop back to your RAW files? At the same time, the plug-in API also hooks into Photoshop the same way that it currently does with your digital camera. If you are using Camera Raw to make a batch change to your RAW files, you can now batch export those changes back to your camera and then import them back into your camera's raw file without having Photoshop conflict with Camera Raw.
